Claim Amendments and Listing:

- 1. (Currently Amended) A tape measure having:
 a spooled measuring blade mounted via mounting means within a casing, the spooled
 measuring blade being rotatable with respect to the case about a rotation axis;
 and
 resilient means interposed in the mounting means between the spooled blade and the case,
 wherein the resilient means permits but urges against displacement of the spooled blade with
 respect to the case in a direction radial to the rotation axis.
- 2. (Original) A tape measure according to claim 1 wherein the spooled blade is rotatable with respect to the resilient means.
- 3. (Original) A tape measure according to claim 2 wherein the resilient means is interposed between the casing and an axle element which is fixed with respect to casing.
- 4. (Currently Amended) A tape measure according to claim 2 or claim 3 wherein the resilient member is a bush or cup.
- 5. (Original) A tape measure according to claim 1 wherein the mounting means includes a spooling device and the resilient means is rotatable with the spooling device with respect to the casing.
- 6. (Currently Amended) A tape measure according to claim 5 wherein the spooling device has a slide member which acts to guide the blade during spooling and unspooling, the resilient member being formed in the side member portion.
- 7. (Currently Amended) A tape measure according to claim 5 or claim 6 wherein the spooled blade is located on an outer portion of the spooling device.
- 8. (Original) A tape measure according to claim 7 wherein the resilient member is formed in the spooling device and is located between the outer portion of the spooling device and a bearing surface of the spooling device.

- 9. (Original) A tape measure according to claim 8 wherein the resilient member is a connecting element which connects the outer portion of the spooling device to the bearing surface of the spooling device, the connecting element being shaped so that at least a part has a transverse component of force acting to bend it under a force acting radially between the bearing surface and the outer portion.
- 10. (Currently Amended) A tape measure according to <u>claim 9</u> elaim 10 wherein the resilient member is a series of connecting elements disposed around the bearing surface.
- 11. (Original) A tape measure according to claim 10 wherein the connecting elements form a spiral shape from the outer portion towards the bearing surface or are selected from S-shape, Z-shape, W-shape, V-shape, U-shape, C-shape, L-shape, dog-leg shape, concertina-shape, or combinations thereof.
- 12. (Currently Amended) A tape measure according to claim 10 or claim 11 wherein gaps between adjacent spokes/struts are filled with a resilient or shock-absorbing material.
- 13. (Currently Amended) A tape measure <u>according to claim 1</u> having a <u>spooling device</u> on which the <u>spooled measuring</u> blade is mounted <u>via a spooling device within a case</u>, the <u>spooled measuring blade and the spooling device being rotatable with respect to the case about a rotation axis</u>; and stop means located to abut against cooperating means on the spooling device on displacement of the spooling device with respect to the case <u>in a direction radial to the rotation axis</u>, wherein the stop means is a step, protrusion or recess formed in the inner surface of a side wall of the casing which extends substantially all the way around the casing and the corresponding cooperating means on the spooling device is a step, recess or protrusion, respectively.
- 14. (Original) A tape measure according to claim 13 wherein the stop means is located so that displacement of the spooling device with respect to the casing is stopped or urged against at a displacement less that that required to cause failure or damage to an axle element about which the spooling device is rotatable.
- 15. (Canceled)

16. (Currently Amended) A tape measure according to <u>claim 13</u> elaim 15 wherein the stop member is an annular stop ring connected to or formed in the casing and extending adjacent to the spooling device.

17. (Canceled)

18. (Currently Amended) A tape measure <u>according to claim 1</u> having a spooled measuring blade mounted within a case, and resilient means selectively located at the outer surface of the case, the location or locations of the resilient means being selected according to the vulnerability to impact of the location or locations the resilient means being formed by moulding-in resilient material into corresponding recesses formed in the casing.

19. - 23. (Canceled)

- 24. (New) A tape measure having a spooled measuring blade mounted via a spooling device within a case, the spooled measuring blade and the spooling device being rotatable with respect to the case about a rotation axis; and stop means located to abut against cooperating means on the spooling device on displacement of the spooling device with respect to the case in a direction radial to the rotation axis, wherein the stop means is a step, protrusion or recess formed in the inner surface of a side wall of the casing which extends substantially all the way around the casing and the corresponding cooperating means on the spooling device is a step, recess or protrusion, respectively.
- 25. (New) A tape measure according to claim 17 wherein the stop means is located so that displacement of the spooling device with respect to the casing is stopped or urged against at a displacement less than that required to cause failure or damage to an axle element about which the spooling device is rotatable.
- 26. (New) A tape measure according to claim 17 wherein the stop member is an annular stop ring connected to or formed in the casing and extending adjacent to the spooling device.

27. (New) A tape measure according to claim 17 having resilient means selectively located at the outer surface of the case, the location or locations of the resilient means being selected according to the vulnerability to impact of the location or locations, the resilient means being formed by moulding-in resilient material into corresponding recesses formed in the casing.
